

Recoverable payloads explain rescued tasks

Two LOCA traces where SMC succeeds while deletion/compaction baselines fail. The evidence is observed archive and payload-read/use events, not a status-board mechanism.

NHL back-to-back schedule analysis

NhlB2bAnalysis/state0 5 archive calls | 17 payload read/use calls | 64 steps

Mechanism: bulky observations leave the prompt, but exact transcripts remain addressable and are read back when computation needs them.

WooCommerce low-selling product filter

FilterLowSellingProducts/state1 4 archive calls | 3 payload read/use calls | 38 steps

Mechanism: bulky observations leave the prompt, but exact transcripts remain addressable and are read back when computation needs them.

Interpretation: masking/clearing can make context smaller, but once an old observation is gone the agent has no route back to exact rows. SMC preserves an addressable transcript payload.
